

A BASF Plant Science  
Company

## The Challenges of [high-throughput] Phenotyping

Mount Hood - sept 2008

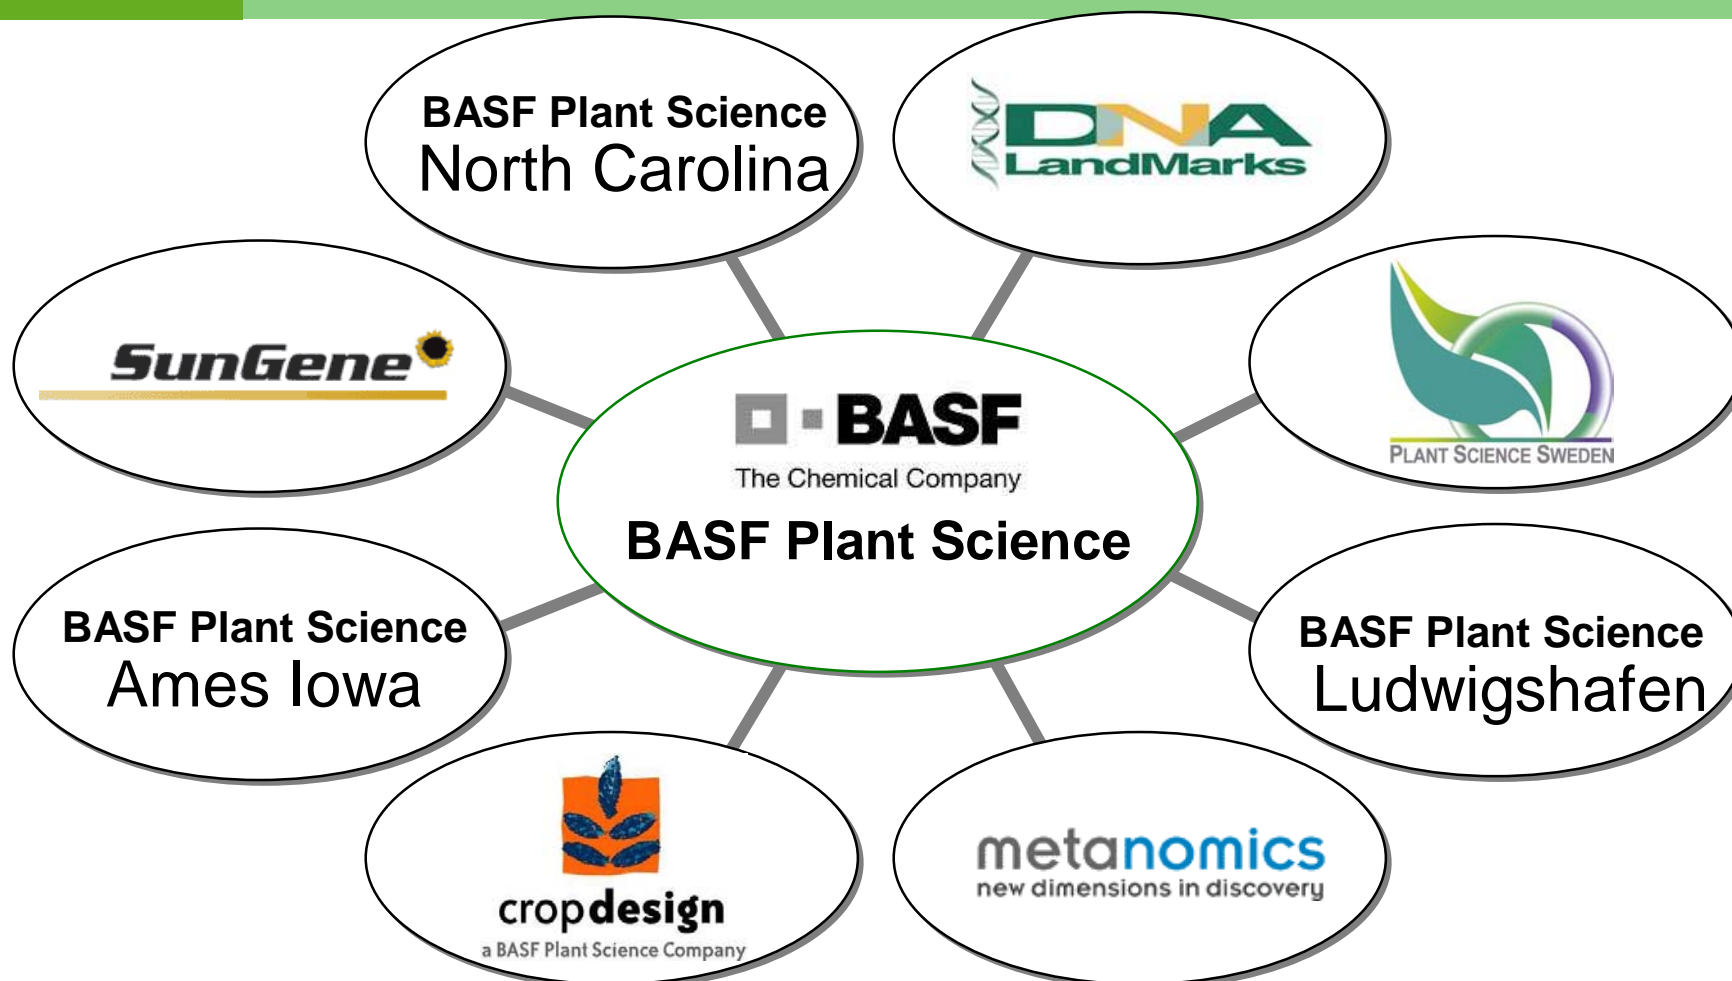

# Topics

- Introducing BASF Plant Science
- Phenotyping, for what purposes?
- What are the challenges?
- High-throughput phenotyping
  - ⇒ The TraitMill example
- What is the output?
  - ⇒ Some lead examples
- Future developments

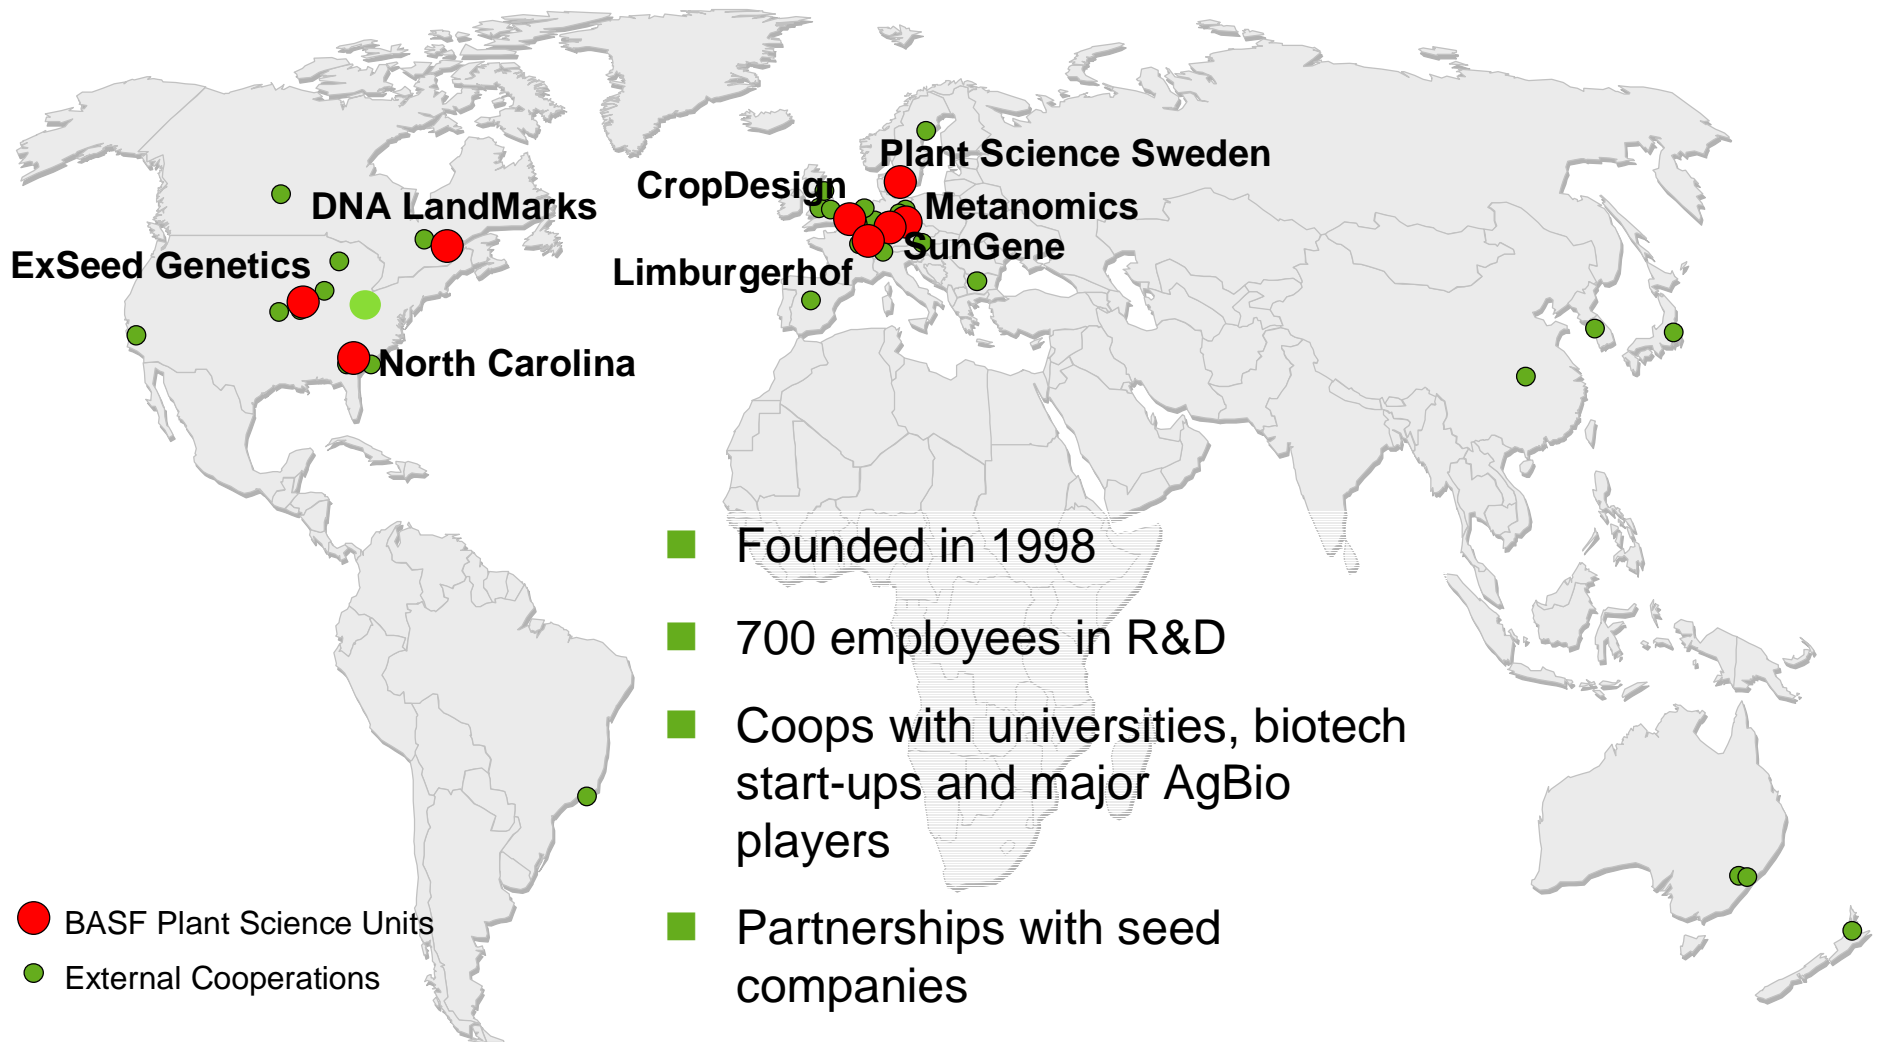

# BASF Plant Science: a Global Technology Platform

# Global R&D Platform

# CropDesign at a Glance

**cropdesign**  
a BASF Plant Science Company

- Headquartered in **Gent**, Belgium; **90** employees
- Founded in **1998** as a spin-off from **VIB**, acquired in June **2006** by **BASF** Plant Science
- Focus on the development of **high productivity traits** by operating a unique rice-based trait discovery platform
- Focus on **rice** as a commercial crop opportunity and as a model for **corn**

# The BASF approach to gene discovery: unique technology platform

## Crop yield improvement

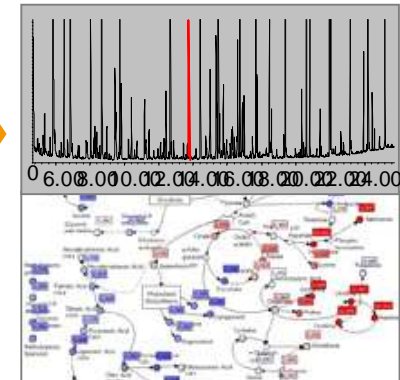

CropDesign

Look  
at plant

BASF Plant Science

Look  
inside

metanomics

Unique and synergistic platform for gene function discovery  
Combines visual plant screening & metabolic profiling for gene function analysis  
High throughput at 5,000 to 10,000 genes tested per year

Some lead examples
- Future developments

# Trends driving demand for agricultural products

## Food & Feed

- UN estimate\* on world population: 9.2 billion people for 2050
- Rising social standards drive global demand for more processed food (meat consumption in Asia)

## Biofuels\*\*

- Worldwide: Programs to support bio-fuel projects
- EU biofuel target:  
10% of total transportation fuel by 2020:  
→ 55% of total agricultural land needed to reach the target (in canola)

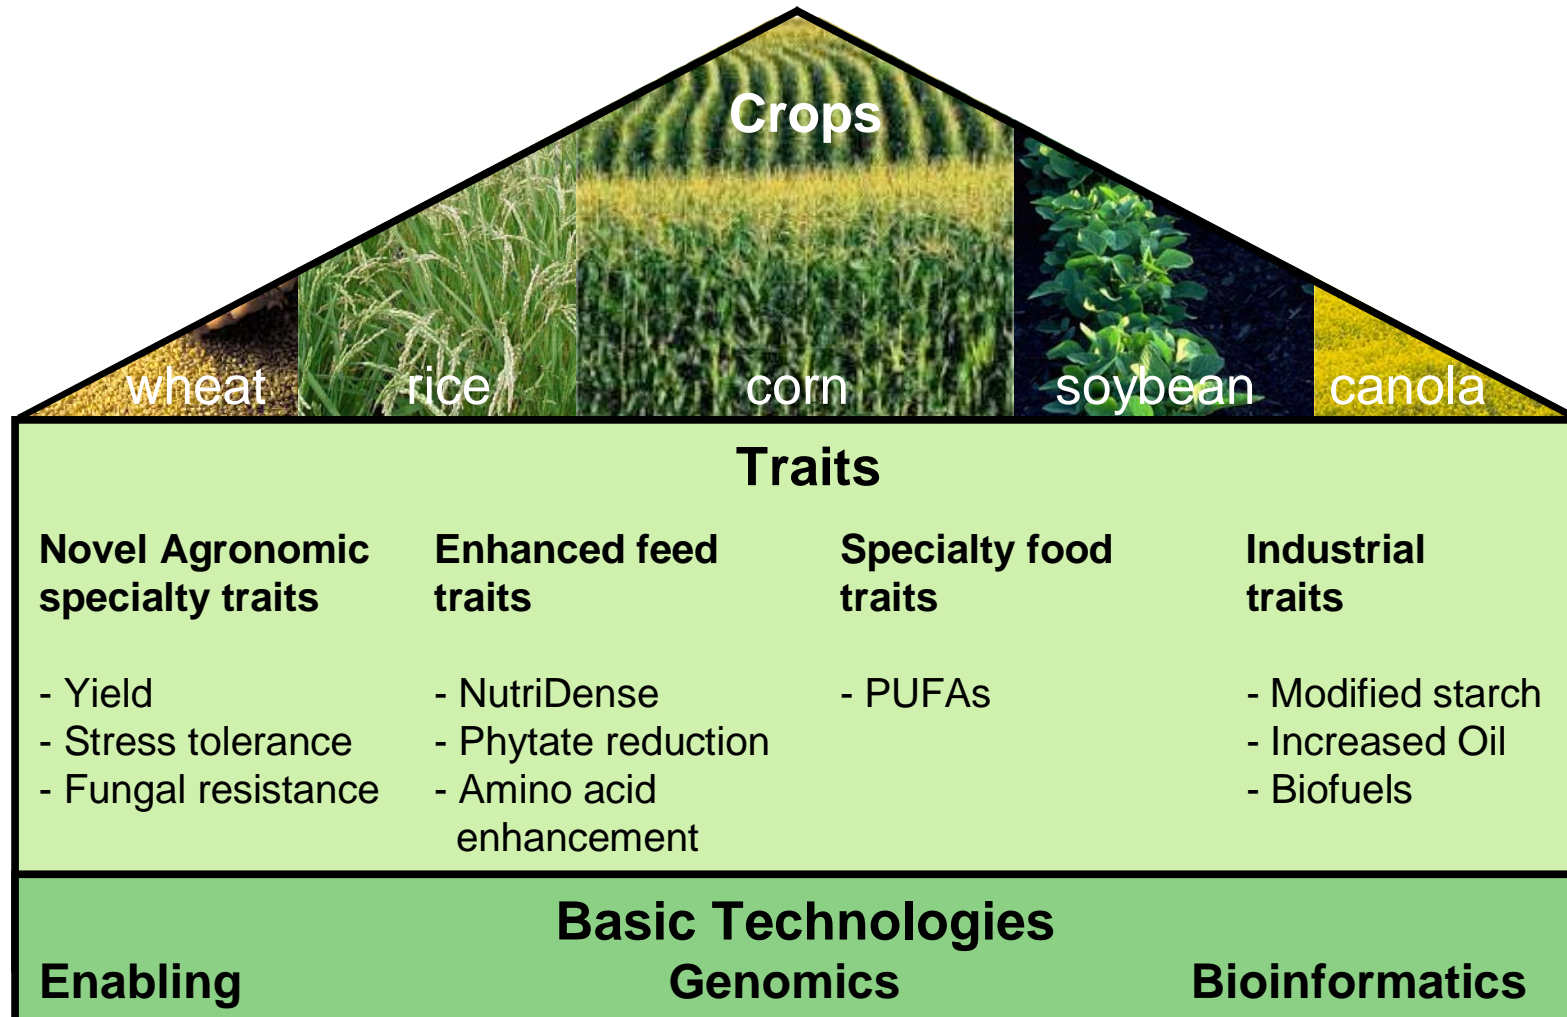

- ▶ **To meet the demand we have to double productivity within the next 20 years**

\*Published in May 2007 by the UN;

\*\* EU-Directive, March 2007

## Our Projects

- Introducing BASF Plant Science
- Phenotyping, for what purposes?
- **What are the challenges?**
- High-throughput phenotyping  
The TraitMill example
- What is the output?  
Some lead examples
- Future developments

# What are the challenges?

- High Throughput
  - Low costs
- }
- Efficient logistics
  - Automation
- 
- Early discovery
  - Predictability
- }
- Model plants
  - Screening strategy
  - Traits
- 
- Organize the data flow
- LIMS
  - Productivity tools

# Key traits

**cropdesign**

a BASF Plant Science Company

## Established field crop markets (corn, soybean,...)

- Seed yield
- Seed number
- Grain filling rate
- 1000 seed weight
- Harvest index
- Heading time
- Development rate
- Root biomass
- Root shoot ratio

## Rice

- Seed yield
- Seed number
- Grain filling rate
- 1000 seed weight
- Harvest index
- Heading time
- Development rate
- Root biomass
- Root shoot ratio

## Bioenergy crops (sugarcane, switchgrass,...)

- Leafy biomass
- Plant height
- Development rate
- Oil content
- Rooty biomass
- Root thickness
- Root shoot ratio

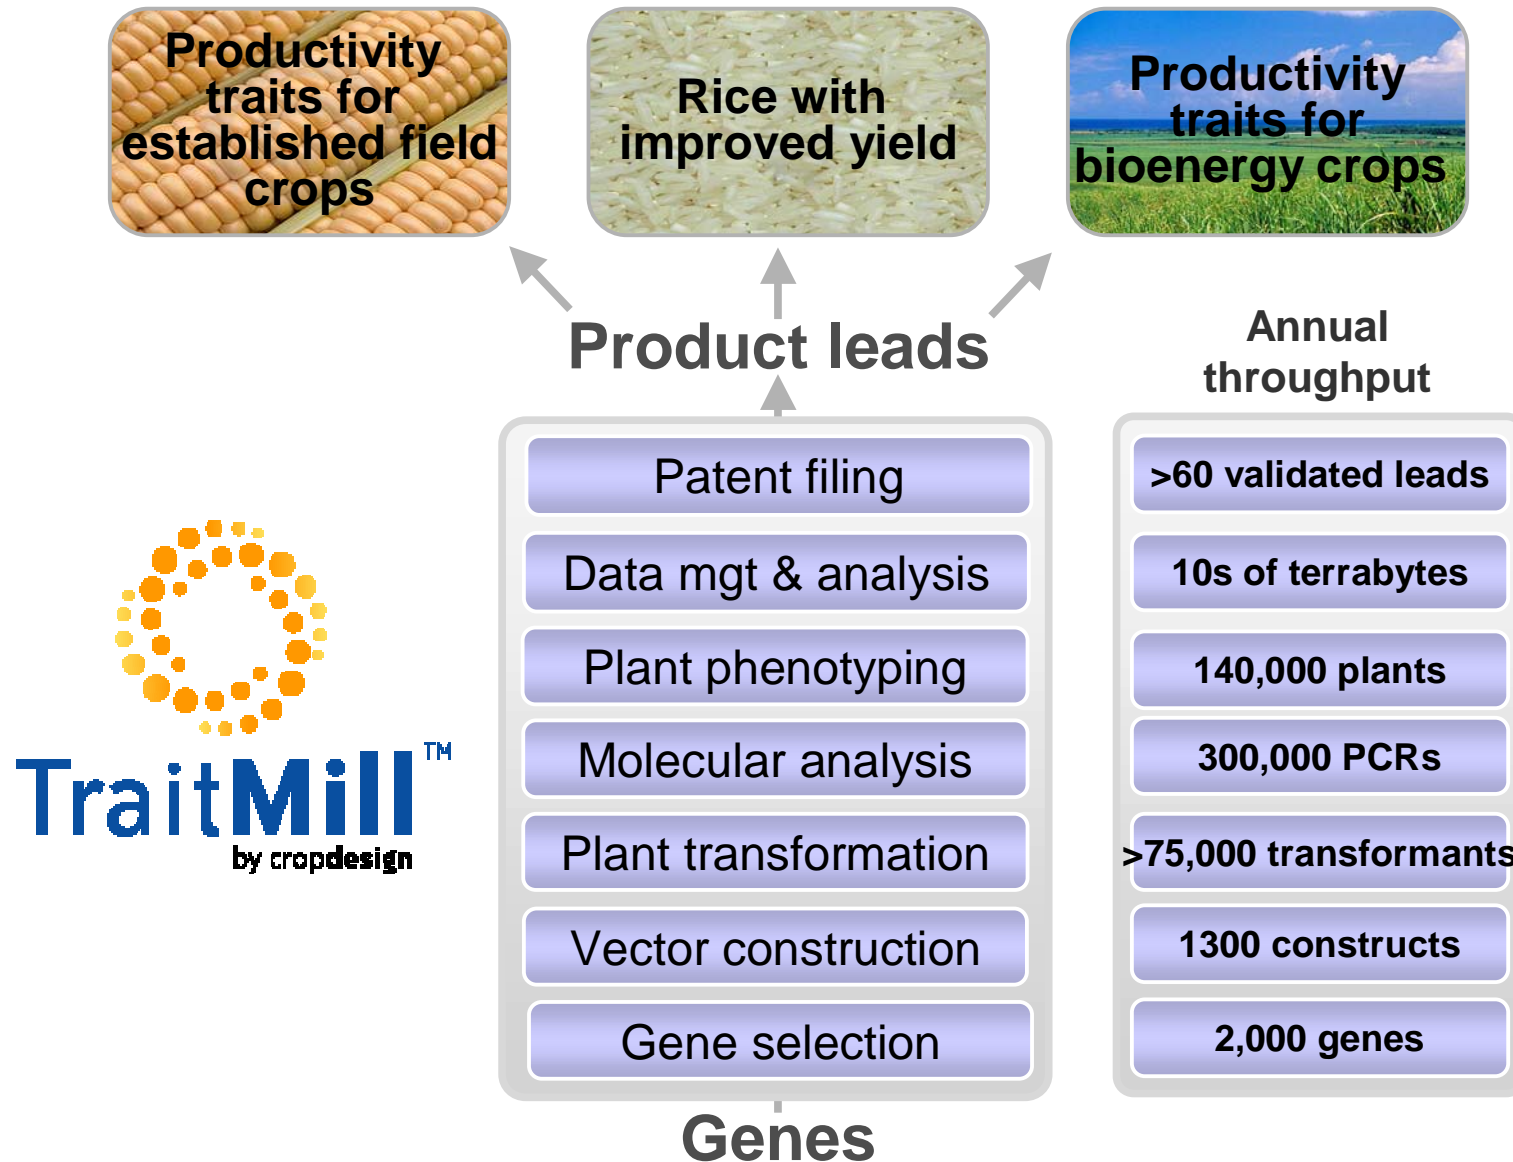

- Introducing BASF Plant Science
- Phenotyping, for what purposes?
- What are the challenges?
- High-throughput phenotyping:
  - ⇒ The TraitMill example
- What is the output?
  - Some lead examples
- Future developments

# Field Validated Leads

- By end of 2006, 56 Leads tested in at least 1 field trial
- Field confirmation rate close to 50 %

**Lead confirmed in field:**

positive phenotype  
observed in TraitMill™  
confirmed in 2 field trials

**Lead not confirmed in field:**

positive phenotype  
observed in TraitMill™ not  
confirmed in 2 field trials

**Pending:**

1 field trial result or  
conflicting results after 2  
trials

# Integration of Phenotyping & Metabolic Profiling Create Unique Opportunities

## Analyze phenotype

Determine yield

## Metabolic profiling

+

Expression profile

- Identify important pathways
- Characterize mode of action
- Rational identification of new lead genes based on pathway knowledge
- Increased efficiency & efficacy of gene discovery

## R&D Commercialization Collaboration with Monsanto

### Joint R&D and Commercialization Collaboration for Future Growth

March 21, 2007

MONSANTO

 **BASF**  
The Chemical Company

- **Trait: High yield and abiotic stress tolerance**
  - Independent gene discovery programs
  - Joint research pipeline
  - Commercialization through Monsanto
- **Crops: corn, soybean, cotton, canola**
- **Revenue sharing: 60/40 (Mon/BASF)**
- **Additional coop: Soybean cyst nematode**

# Monsanto Collaboration

## From Discovery through Commercialization

### Focus:

- Establishment of a joint technology & commercialization collaboration
- Combination of BASF and Monsanto expertise
- R&D-pipeline for yield and stress tolerance traits
- Corn, soybean, canola, cotton

### Structure:

### Discovery

- Maintenance of independent discovery programs in each company
- Nomination of projects for development to jointly managed board

### Development

- Funding at 50-50 cost sharing
- Potential overall budget of €1.2 billion/ \$1.5 billion through all phases of development

### Commercialization

- Emerging products distributed by Monsanto across its three existing commercial channels
- Value sharing at 60% for Monsanto and 40% for BASF

# Conclusions

## TraitMill: result of continuous improvements

- Example of cost-effective, highly automated platform for screening yield-enhancement genes
- Large effects (>20%) on yield
- Different yield components: opportunities for trait stacking
- In some cases, increased yield stability
- Phenotypes in the greenhouse confirm under field conditions
- Transferability of transgenic traits to other crops is ongoing

**Thank you**
